

Futcamedic

Multi-Tenant Football Academy Management Platform

Product Team
Futcamedic

May 5, 2026

Product Definition: Futcamedic

The One-Sentence Definition

A web and mobile application where football academy owners log in to manage students, track attendance, collect payments, and schedule training sessions across multiple categories and venues.

Product Type

Tool — Users access the software via web or mobile app and perform daily operations.

The Buyer

- **Who:** Football academy owner or director, managing 50-500 students across 4-12 categories, employing 5-20 teachers, operating 1-5 venues
- **Before:** Used paper notebooks for attendance, WhatsApp groups for scheduling, manual cash collection for payments, Excel sheets for student records, phone calls to notify parents
- **After:** Logs into a unified dashboard on Day 30, sees real-time attendance rates, payment status of all students, upcoming training sessions, and sends automated push notifications to parents — all from a mobile phone

Day-1 Experience

1. Academy owner registers school at `/register` with school name, full name, email, password
2. Receives email confirmation from Supabase Auth
3. Logs in at `/login` with credentials
4. Changes temporary password (if invited) or proceeds directly (if owner)
5. Creates first category (e.g., “U-12”) by selecting birth year range
6. Invites first teacher via email (system sends invite with temporary password)
7. Adds first 5-10 students to the category with parent contact info
8. Schedules first training session with date, time, venue, and category

What They Receive

- **Web access:** React web app at `web/` with full admin capabilities
- **Mobile access:** Expo React Native app for iOS/Android with role-based tabs
- **Multi-tenant isolation:** Each school’s data completely separated via `school_id`
- **Push notifications:** Automated alerts to parents when payments are recorded
- **Storage:** Supabase Storage bucket for student profile photos
- **Export capabilities:** PDF and Excel reports for payments and attendance

What They Do NOT Have to Do

- Manually calculate attendance percentages (system computes automatically)
- Send individual payment reminders (bulk registration with auto-notify)
- Track which teacher manages which category (system assigns and filters)

- Worry about other schools seeing their data (RLS enforces isolation)
- Build recurring events manually each week (recurrence engine generates sessions)

What They Still Have To Do

- Input student data manually (no bulk CSV import yet)
- Collect cash/transfers outside the system (payment recording is manual entry)
- Verify teacher attendance taking (no GPS/location validation)
- Manage parent communications beyond payment notifications
- Handle student medical emergencies (system stores info but doesn't alert)

Evidence Status

Claim	Evidence	Status
Users can register a school and start using the system in 10 minutes	Code review of <code>auth.controller.ts</code> register flow + <code>register.tsx</code>	Verified
Teachers can take attendance for their assigned categories only	<code>requireTenant</code> middleware + <code>attendance.controller.ts</code> category filter	Verified
Parents only see their own children's data	<code>student.controller.ts</code> parent filter + RLS policies	Verified
Payment registration sends push notifications to parents	<code>payment.controller.ts</code> calls <code>sendPushNotification</code>	Verified
Recurring events generate multiple training sessions	<code>event.controller.ts</code> recurrence logic (weekly, biweekly, monthly)	Verified

Open Questions

- How does the academy handle failed push notification deliveries?
- What happens when a teacher is removed from a category mid-season?
- Is there a need for payment receipt generation (PDF receipt with academy logo)?
- Should the system support multiple parent contacts per student?
- What is the expected churn rate after 90 days?
